Abstract

Spending behavior of an individual especially younger generations tend to be alarming as studies revealed that they will cover large amount of consumer spending this year. Those youths may not lead to financial problems on their adulthood if they know how to manage their money wisely. The parents' or guardians' role on teaching financial management to their children is vital. This study focused on the impact of parenting styles to the spending behaviors of senior high school students at Agricultural Science High School of the Western Philippines University, Aborlan, Palawan and to determine if there is a significant relationship between parenting styles of the respondents' parents and spending behaviors of the respondents. This study used a descriptive-correlational research, survey-questionnaire, descriptive statistics and Chi-Square Test. There were 168 that served as the respondents of the study. Majority were female, 18 years old, Roman Catholic and whose parents were college graduate, Tagbanua and not struggling financially. Half of the respondents' parents employ authoritative parenting style; some has neglectful and permissive parent but only few of them has an authoritarian parent. Most of the respondents were essentialist spenders which means that they have better financial management skills. The parenting styles of the respondents' parents does not directly influence the respondents' spending behaviors. It is recommended that a symposium about financial management should be conducted so that students can have a chance to improve their financial management skills. A comparative study on how junior high school students spend money as compared to senior high school students was also recommended.

Keywords: Parenting Styles, Senior High School Students, Agricultural Science High School, Spending Behaviors

Introduction

Students who know how to manage their money or those wise spenders at their adolescent stage will not be mostly involve in financial problems such as large debts in their adulthood. Also, those parents who teach their children on how to save money effectively and the importance of it by using authority and showing love at the same time will lead their children in achieving better financial management skills (Berns, 2007). However, the spending behavior of youth today is alarming as they continue to buy their unending wants that may result to different financial problems (Bona, 2017). Spending behavior is vital because it serves as first step in understanding the buying and spending patterns of consumers since different factors are linked to it (Juneja, 2017).

Parenting style is the constellation of attitudes or a pattern of parental authority towards the child which are conveyed to the child, creating the emotional context for the expression of parent behavior and development of their child's behavior (Michalos, 2014). Furthermore, family members and social status served as a major influence on someone's shopping patterns and consumer habits. Families and parenting style influence purchases in many ways. At first, the

influence of parents is significant because of how parents help their children to develop political and religious beliefs, lifestyle choices, and consumer preferences. Most people are who they are because of their parents. Secondly, one's purchasing habits and consumer behavior depends on which social class he or she belongs (Lumen Learning, 2018). Relatively, Mass Live Media Marketing (2018) revealed that younger generations by year 2020 will cover almost 40% of consumer spending and will also serve as a huge effect on consumerism. Therefore, this study aims to determine the impact of parenting style of respondents' parents, spending behavior of the respondents and the significant relationship between parenting styles of respondents' parents and spending behavior of respondents.

The results of this study will be useful to the school administrators, teachers and parents since they can help the students to have better financial skills. Specifically, the identified problem in this study will lead school administrators to conduct symposiums about financial management or even hire financial aid counselor that will teach students on how to spend wisely.

Methodology

This study was conducted to 168 senior high school students of Western Philippines University-Agricultural Science High School, in San Juan, Aborlan, Palawan who are enrolled during the School Year 2019-2020 from January to April, 2020. Descriptive–correlational research using self-made survey questionnaire was employed. Descriptive method was employed to determine the parenting styles of respondents' parents, and the spending behaviors of the respondents. On the other hand, correlational research was utilized to assessed the relationship between parenting styles of respondents' parents and the spending behaviors of the respondents. According to McCombes (2019), descriptive research systematically describes a population, situation or phenomenon, while correlational researches measures two variables, understands and assess the statistical relationship between them (Bhat, 2018).

The self-made questionnaire that contained questions in determining the parenting style of respondents' parents and the spending behavior of the respondents was presented to the research committee and subjected to the validation by the statistician in order to fit the objectives. Upon the approval, the researchers administered the survey questionnaire to the identified respondents. The researchers gave instructions to the respondents and assisted them in answering the questionnaire by giving clarifications and ample time.

The gathered data were then tallied, tabulated and collated and were subjected to descriptive statistics such as frequency counts, mean, and percentages. While inferential statistics particularly the Chi-Square Test was used to determine if there is a significant relationship between parenting styles of respondents' parents and the spending behavior of the respondents. According to Statistics Solutions (2020), Chi-square test is commonly utilized when testing relationships that exists on the categorical variables in the population.

Results and Discussion

Parenting Styles of the Respondents' Parents

Table 1 presents the parenting styles of the respondents' parents which were categorized into four types: permissive, authoritative, authoritarian and neglectful. Evidently, the data revealed that half (50%) of the respondents' parents employ authoritative

parenting style. It was followed by those parents who practice neglectful parenting style (20.83%) and permissive parenting style (19.05%). While, only few (10.12%) are employing authoritarian parenting. As presented, most of the respondents were raised in authoritative homes while least number has authoritarian parents which means that the behaviors of respondents whose parents is authoritative differs to those who have an authoritarian parent. These findings conformed to the study of Rosenthal (2009) which explained that authoritative parents seek a balance between the teens' desire for independence and the parents' desire to be listened to which lead their children to be socially responsible, self-regulated and cooperative. While, authoritarian parents are very strict, have a strong sense of justice and always seek obedience. For that instances, children of authoritarian parents tend to be timid, lack of spontaneity, has lower self-esteem and rely to unusual degree on the voice of authority with lower degree of independence. Also, the findings indicate that some of the respondents' parents employs neglectful and permissive parenting which conforms to Diana Baumrind's Theory which states that there are four parenting styles which includes: authoritarian, authoritative, permissive and neglectful.

Table 1. *Parenting styles of the respondents' parents*

<i>Parenting Style</i>	<i>Frequency (n=168)</i>	<i>Percentage (%)</i>
Permissive	32	19.05
Authoritative	84	50.00
Authoritarian	17	10.12
Neglectful	35	20.83

Spending Behaviors of the Respondents

Table 2 shows the spending behaviors of the respondents which were categorized into four types: essentialist, emotional, extravagant and egoistic. Evidently, the data revealed that 86.31% of the respondents were essentialist spenders. It was followed by the emotional spenders (10.12%) and extravagant spenders (2.38%). While, there were only 1.19% of the respondents who were egoistic spenders. As presented, most of the respondents were essentialist spenders which means that they commonly spent money to buy things that they really need that makes them a wise spender. Also, the data revealed that most of the

respondents assess the consequences first before buying anything and do not let their emotions, ego and popularity to affect the way they spend money. The result strengthens the findings of Genilla (2019) stating that essentialist spenders are those individuals who live with the basics since they prioritize their needs which allow them to spend less and save more.

Table 2. *Spending behavior of the respondents*

<i>Spending Behavior</i>	<i>Frequency (n=168)</i>	<i>Percentage (%)</i>
Essentialist	145	86.31
Emotional	17	10.12
Extravagant	4	2.38
Egoistic	2	1.19

Relationship between parenting styles of respondents' parents and spending behaviors of the respondents

Table 3 presents the relationship between parenting styles of respondents' parents and spending behaviors of the respondents. As shown, result revealed that a p-value of 0.153 is less than the 0.05 level of significance. Therefore, the null hypothesis that "there is no significant relationship between parenting styles of respondents' parents and spending behaviors of respondents" is accepted. This implies that parenting styles of respondents' parents does not directly influence the respondents' spending behaviors. Similarly, Aguila (2019) concludes that there was no single distinct parenting style that parents perceived they were using and that students experienced but assures that parents really differed among themselves on whom and how they patterned their parenting style. Also, such result strengthens the suggestion of the study of Howard (2018) that one's lifestyle is still one of the major factors that affects the spending patterns of an individual.

Table 3. *Relationship between parenting styles of respondents' parents and spending behaviors of the respondents*

<i>Parenting Styles</i>	<i>Spending Behaviors</i>				<i>Total</i>
	<i>Essentialist</i>	<i>Emotional</i>	<i>Extravagant</i>	<i>Egoistic</i>	
Permissive	29	2	0	1	32
Authoritative	77	5	1	1	84
Authoritarian	12	4	1	0	17
Neglectful	27	6	2	0	35
Total	145	17	4	2	168
Chi Square= 13.214ns p. 0.153 Decision Rule: Accept H ₀					

Conclusion

Based on the significant findings of the study, the following conclusions were drawn:

1. The respondents' parents have different perceptions and sources of knowledge on what is the most-effective child-rearing that will make their children be a better spenders since most of them were mostly college graduates while some were only able to reach high school and elementary levels.
2. Most of the respondents' parents employ an authoritative parenting style and very few of the respondents have an authoritarian parent.
3. Some parents tend to be permissive and neglectful parents to their children.
4. Among the four spending behaviors, most of the respondents were essentialist spenders which means that they have financial management skills.
5. Finally, the parenting styles of the respondents' parents do not directly influence the respondents' spending behaviors.

Recommendations

Based on the findings and conclusions of the study, the following recommendations were drawn:

For the Campus Administrator

1. If possible, hire a financial aid counselor that will teach students not only to senior high school students but also to those students in junior high and elementary level.
2. If available, offer trainings and seminars regarding financial management mostly to those who teach lesson about economics and business management.

For the ASHS Administration

1. Conduct or organize a symposium about financial management so that students can have a chance to improve their financial management skills.
2. Establish and maintain close relationship and camaraderie with the administrators, teachers, parents and students.

For the Senior High School Students

1. If you are a wise spender, maintain that spending behavior and even improve that upon entering adulthood. While, if not, start having

realizations and learned from that in order to avoid financial problems.

For Parents

1. Establish a good connection with your children mostly in their childhood and adolescence stage through expressing love while showing authority.
2. Give some tips that will help your children to develop their financial management skills.
3. Train them and allocate time for such significant phase of life wherein knowledge is attainable.
4. Check and monitor the activities of your children because maybe, they do not experience financial issues but experiencing other problems instead which can be worse.

For Future Researcher

1. Similar research study to be conducted in other universities with larger number of respondents and then compare the results.
2. Conduct a comparative study on how junior high school students spend money as compared to senior high school students.
3. Lastly, conduct a similar study using the socio-demographic profile of the respondents and find the significant relationship of it to spending habits.

Acknowledgment

The authors would like to thanks specially the Almighty God, for everything He has done, does, and is yet to do and for giving everything. The Agricultural Science High School management for allowing the researchers in the gathering of data. The research committee members in their patience in checking, editing, and giving ample time to improve the manuscript. And to the senior High School Students of Western Philippines University-Agricultural Science High School in providing the data.
